KEEP YOUR SOLAR PANELS CLEAN & IMPROVE EFFICIENCY

Debris from dust, exhaust deposits, bird droppings, salt deposits if you live near the sea and tree sap can reduce the output of your photovoltaic system by up to 40%*.

WHY CLEAN SOLAR PANELS?

Dust and dirt can significantly reduce solar panel efficiency and effect the returns from your investment.

- The operating efficiency of a solar PV panel is dependent on the amount of daylight that hits it. If your panels are covered in dirt they are going to produce less electricity.
- Some solar panel manufacturers and installation companies have now made solar panel cleaning a condition of their warranty.
- Naturally occurring rain does help in a small way to clean the panels. However if you didn't clean your windscreen for six months the grime on your windscreen would accumulate. The same principle holds true for solar panels.

Why have Solar Panel Cleaning from BlueBuild Energy?

BlueBuild Energy is one of Northern Ireland's premier Solar Panel Companies. We use the innovative, professional Kärcher iSolar system which allows safe and efficient cleaning of PV systems of any size.

We provide a 5-point solar system health check including:

- Professional solar panel cleaning.
- Inspection of the glass of the panels.
- Framework check of the solar panels for signs of damage.
- Check the roof fixings are intact.
- Check for the signs of damage from birds or squirrels.
